

Funding Equitable Digital Development: A Call to Action

GEO4IMPACT Conference

Paris, France

27-28 May 2025

Run of Presentation

Contents

1. Introduction to the Land Portal
 2. The State of Land Information
 - Key Initiatives
 - Why Data Transparency Matters
 - Digital Public Goods
 3. SOLIndex as Data Decision Making Tool
 4. Land Projects Data Base
 5. Other Use and Application (Corruption)
 6. Conclusion
-
-

This presentation includes results and work from the following colleagues:

Charl-Thom Bayer (LP)

Jonathan Ochom (TI)

Luis Baquero (LP)

Lilian Lee (LP)

Our mission

Nurturing a growing information ecosystem on land governance to inform and improve decision-making, policy and practice at all levels.

Our vision

A world with improved land governance that supports people with insecure land rights, protects those vulnerable to landlessness, and ensures open access to information for all.

Land Portal Foundation

Core Objectives

1. Improve the documentation, mapping and monitoring of land governance issues.
2. Democratize the information ecosystem and strengthen flows of land governance data, from all perspectives and all levels.
3. Promote, inform and enrich the global debate on land issues.

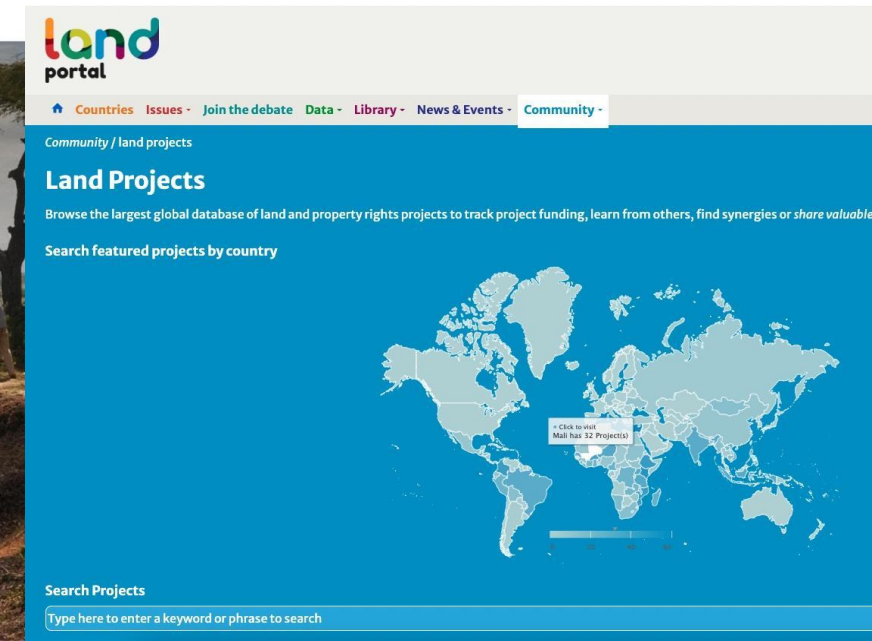

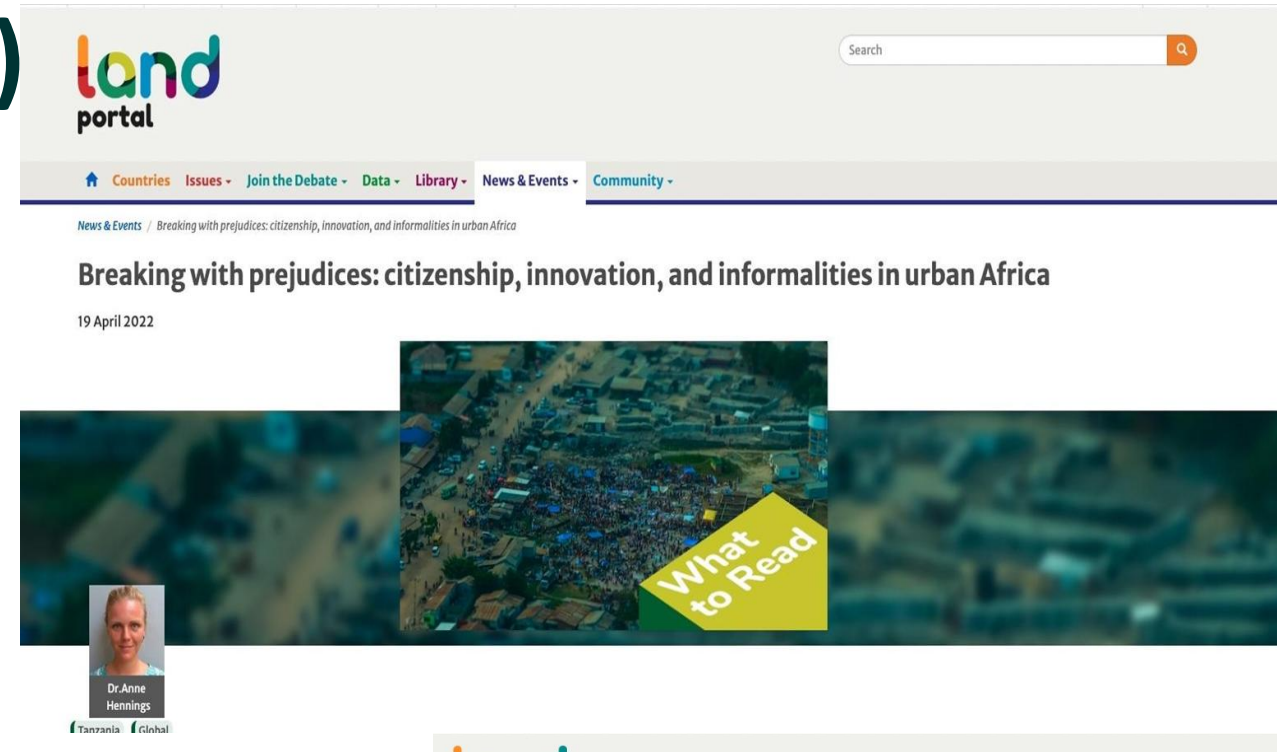

Pillar 1: Inform (Knowledge)

Country & thematic insights

Translating complex data

Land Portal Digital Platform

- 87 peer-reviewed country portfolios
- What to Read digests
- Data stories
- Land Project Database

Pillar 3: Debate (Communication)

Corporate Communications

Media Partnerships

- LANDac Int'l Conference
- GIZ Knowledge Exchange
- CIGOFA3

Voices from the Land: Facilitating Diversity, Equity, and Inclusion

Webinars

- Land Dialogues Series
- Whose Land Webinar Series
- ALIGN Webinar Series

An average of 647 people registered
An average of 186 people joined.

Knowledge Exchange IPLC Pledge Page

- Official page of the Forest Tenure Funders Group
- Tracking the \$1.7 billion pledge
- Featuring donors' annual report

World Bank Land Conference 2025

05 May 2025 – 08 May 2025

World Bank Headquarters 1818 H St NW 20433 Washington, DC United States

MAY 5–8, 2025 WORLD BANK HEADQUARTERS Washington, DC Overview The World Bank Land Conference is the premier global forum for the land sector, bringing together over 1,000 participants
Organizers: World Bank Group

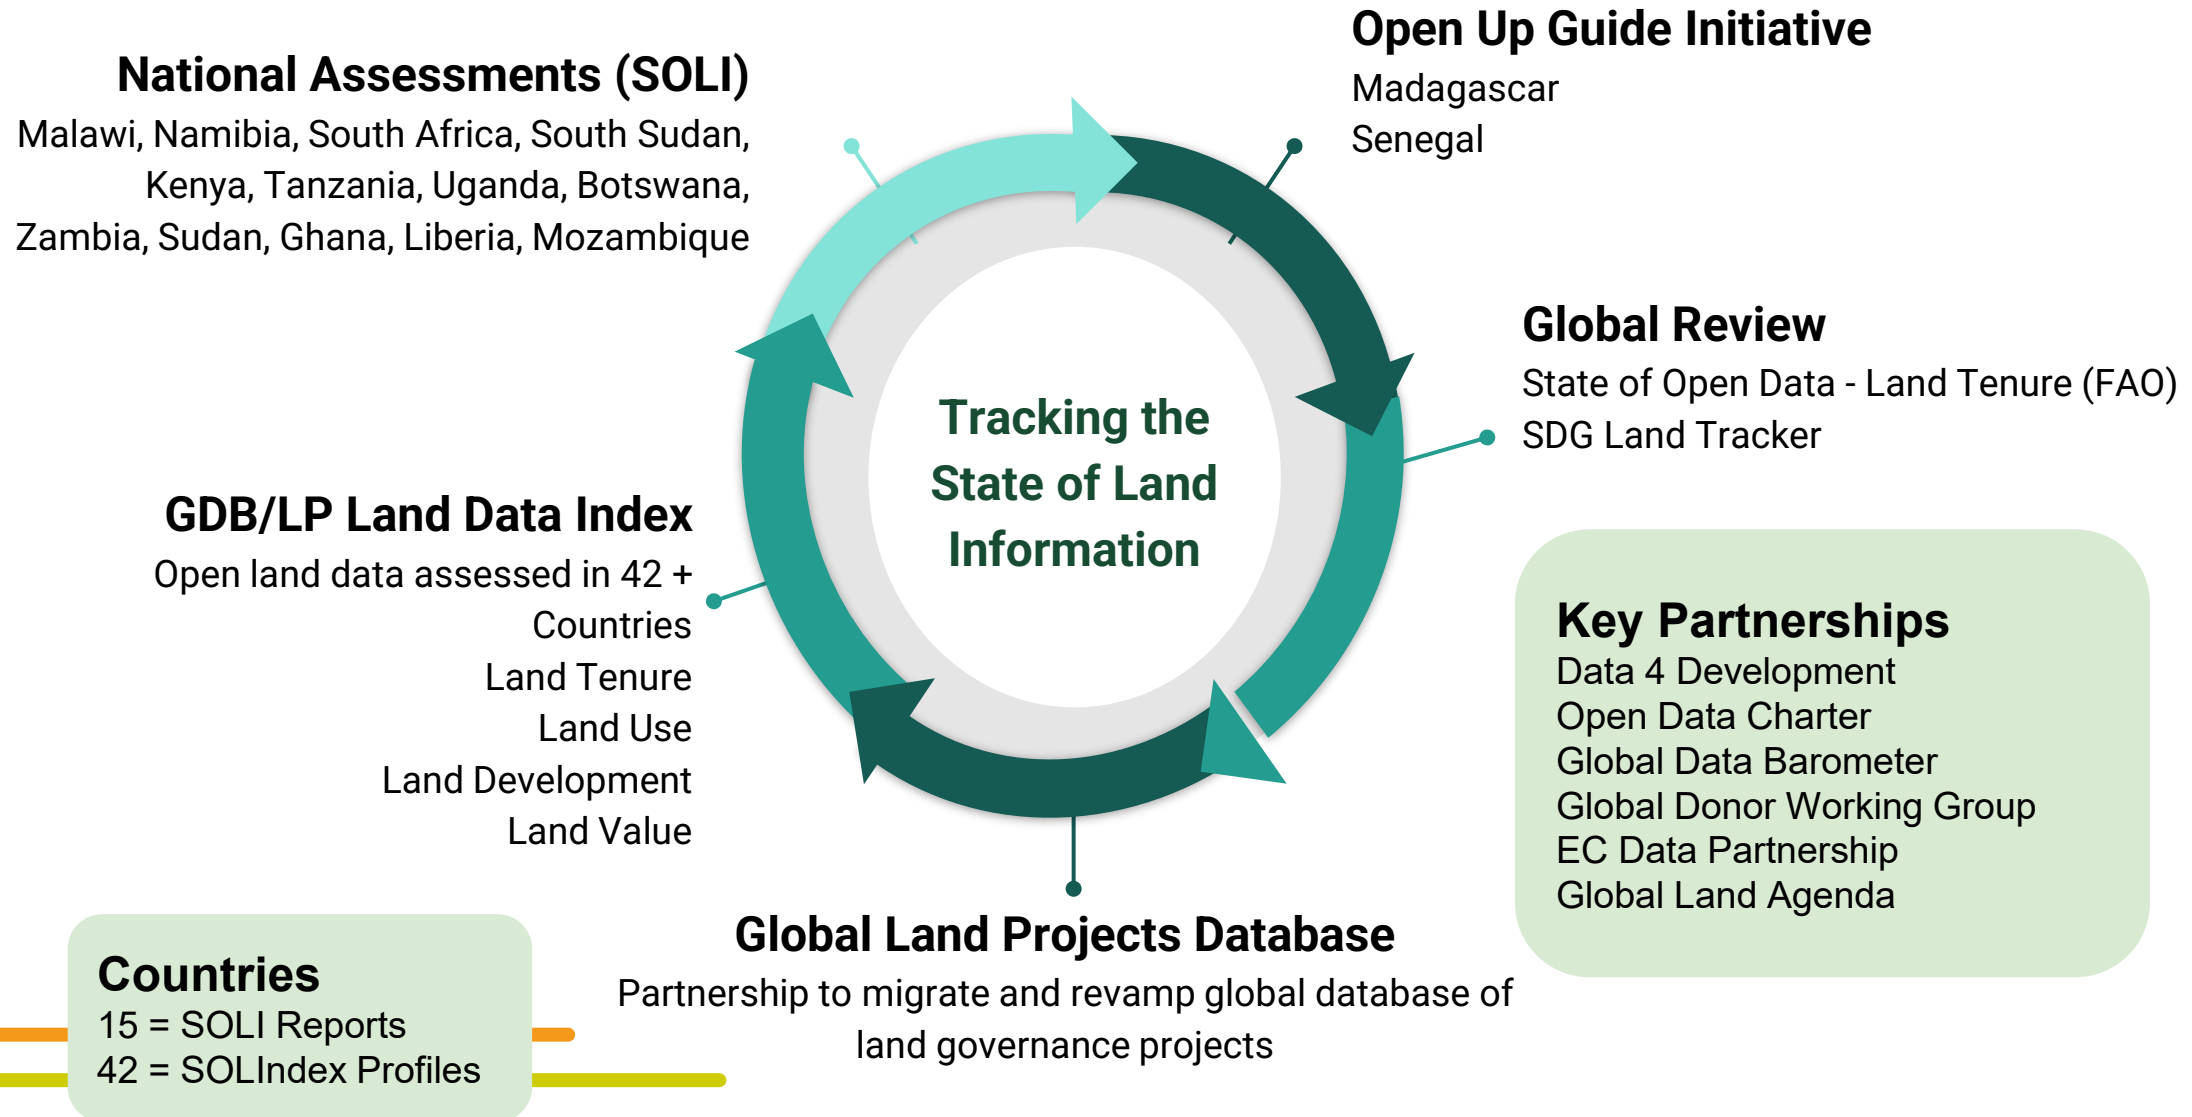

The Twelfth Session of the World Urban Forum (WUF12)

04 November 2024 to 08 November 2024

Cairo, Egypt
WUF12 will focus on localizing the

Pillar 2: Open (Data and Information)

Why Land Data Transparency Matters

The Right To Information is a fundamental human right, but it is also an important enabler of other human rights.

- **Governance:** Transparent land data is crucial for good governance and combating corruption.
- **Public Trust:** Openness fosters trust between citizens and governments.
- **Development Goals:** Access to land information supports the achievement of Sustainable Development Goals (SDGs).
- **Energy Transition:** Reliable land data is crucial for planning and implementing renewable energy projects (site selection, existing rights, environmental rights, community and indigenous rights, local agriculture and resources beneficiation).
- **Diagnostic Tool:** The SOLIndex provides
 - baseline and serve as a diagnostic tool to
 - identify opportunities to improve public access to all forms of land information
 - framing conversations about land and data.

Protecting the Right to Access Information

Access to data and information held by public bodies or authorities is a fundamental human right. Initiatives to operationalise this right are reflected in legal instruments across continents.

Digital Public Goods

- **Transformative Impact:** Digital technologies are reshaping society at an unprecedented pace.
- **Increasing Complexity:** Decision making and progress can be hindered/helped by technology while introducing complex new challenges.
- **Equity Risks:** Benefits are not automatically going to be equally distributed
- **SDG's:** Can support the achievement of sustainable and equitable development.
- **Digital Public Goods:** To ensure that benefits are equitably distributed, the UN High Level Panel on Digital Cooperation [concluded](#) that there is a need to develop broad multi stakeholder alliances to create platforms for sharing digital public goods and develop mechanisms for digital cooperation.

Unlocking the potential of open-source technologies for a more equitable world.

State of Land Information Index (SOLIndex)

SOLIndex: a global index to assess the state of land information at country level

SOLIndex: *measure the **COMPLETENESS** and **OPENNESS** of land data*

Completeness score

Fully Complete
Moderately Complete
Slightly Complete
Not Complete

Openness score

Fully Open
Moderately Open
Slightly Open
Not Open

Understanding the State of Land Information (SOLI) Index

The SOLI Index evaluates the completeness and openness of land-related data in countries across Africa and Latin America. (Currently 42 countries)

- **Purpose:** It serves as a diagnostic tool to identify transparency gaps in land governance data and information.

- **Key Components:**

- **Completeness:** Assesses whether governments collect essential land data (tenure, use, development, value).

- **Openness:** Evaluates if the data is available online, free of charge, interoperable, machine readable, timely, downloadable and legally re-usable.

<https://solindex.landportal.org/#/>

SOLI Score World Average
(currently based on 42/195 World Countries)

Key Findings from the SOLIndex

In many countries, essential land data is either missing or unpublished.

- Many countries still do not publish sufficient open data on land tenure, use, development and value.
- Legal and Policy data is the most open with a score of almost 50.
- Approximately 70% of 42 assessed countries - corruption and low land data transparency.
- This lack of transparency creates opportunities for corruption and hinders accountability.
- Lowest Score (6) for **Land Value** data. This information is critical to understanding how land as a resource is used and this is often an area where opportunities for corruption are most prevalent.

Implications for Energy Transition: Without transparent land data, renewable energy initiatives risk exacerbating existing inequalities and may face resistance from affected communities.

The State of Land Data

A map showing the country scores in the SOLIndex.

SOLIndex 2024

Map showing the availability - product of - completeness and openness of land data and information in 42 countries.

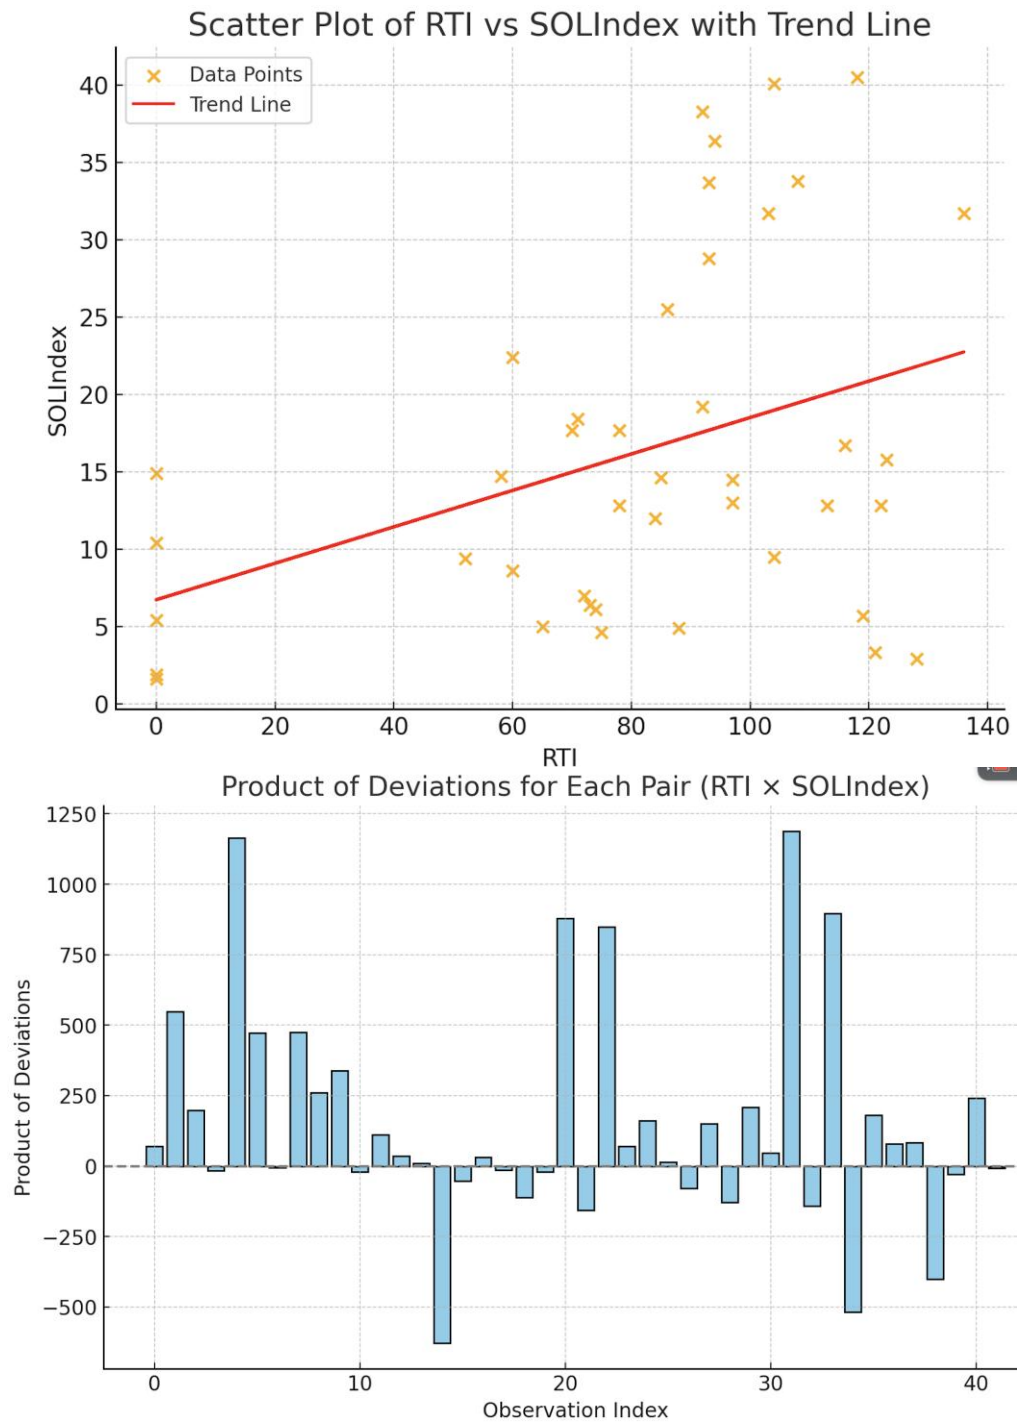

Map: C-T H Bayer • Source: [The Land Portal Foundation](#) • [Get the data](#) • Created with [Datawrapper](#)

Key Findings from the SOLIndex

In many countries, essential land data is either missing or unpublished.

- Many countries still do not publish sufficient open data on land tenure, use, development and value.
- Legal and Policy data is the most open with a score of almost 50.
- Approximately 70% of 42 assessed countries - corruption and low land data transparency.
- This lack of transparency creates opportunities for corruption and hinders accountability.
- Lowest Score (6) for **Land Value** data. This information is critical to understanding how land as a resource is used and this is often an area where opportunities for corruption are most prevalent.

Implications for Energy Transition: Without transparent land data, renewable energy initiatives risk exacerbating existing inequalities and may face resistance from affected communities.

How to Use the SOLIndex for Advocacy and Reform

In many countries, essential land data is either missing or unpublished.

Advocate for Change: Engage with policymakers to promote the publication and accessibility of land records.

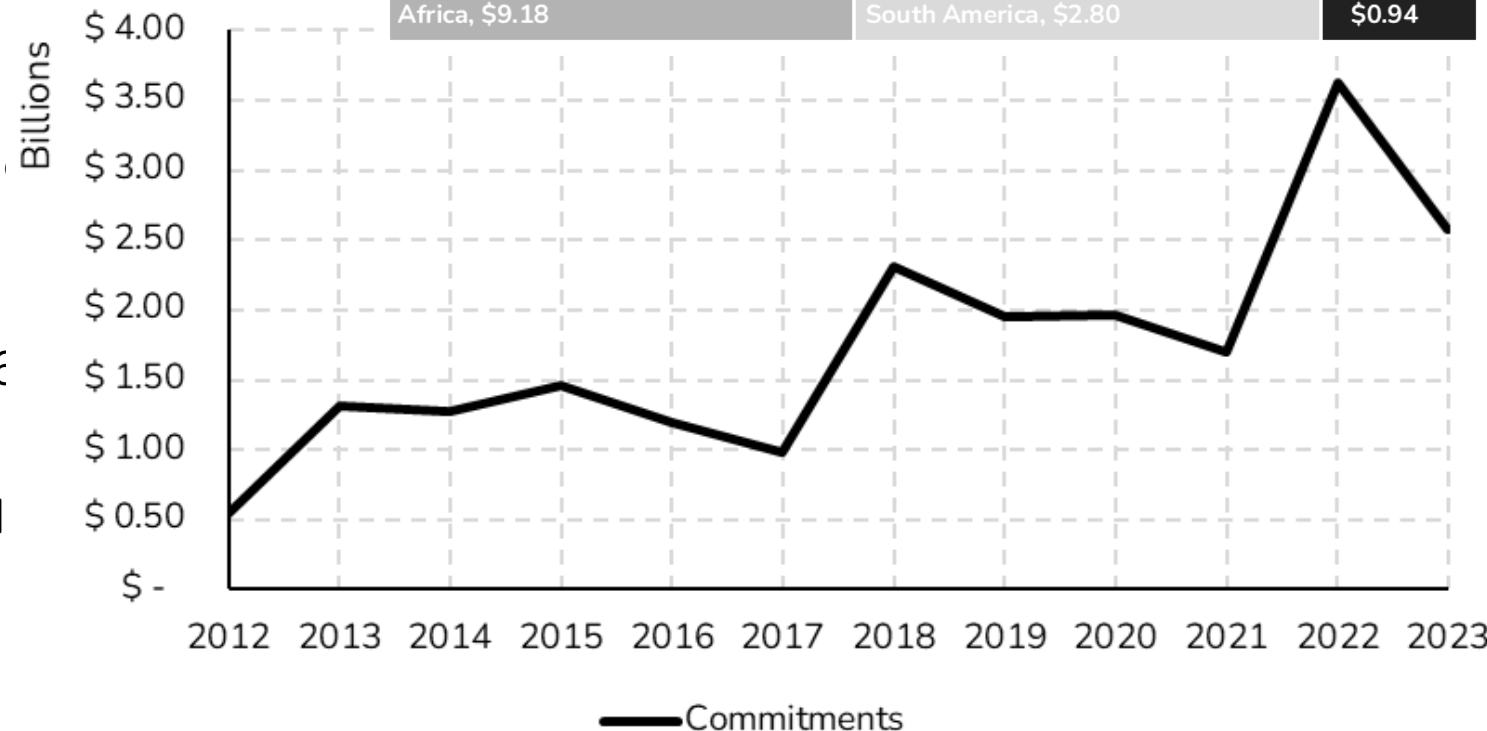

- a. Global and National Levels (Which countries need to improve, who can they learn from)
- **Identify Gaps:** Use the SOLI Index to pinpoint where land data is lacking or inaccessible. Where can countries Improve!
- **Public Engagement:** How can we engage in land development decision if we do not know what is happening? Encourage citizens to ask, **WHO** is doing **WHAT** and **WHERE** are they doing it?

Support Energy Transition: How can we leverage SOLI data to ensure that renewable energy projects are developed transparently and equitably.

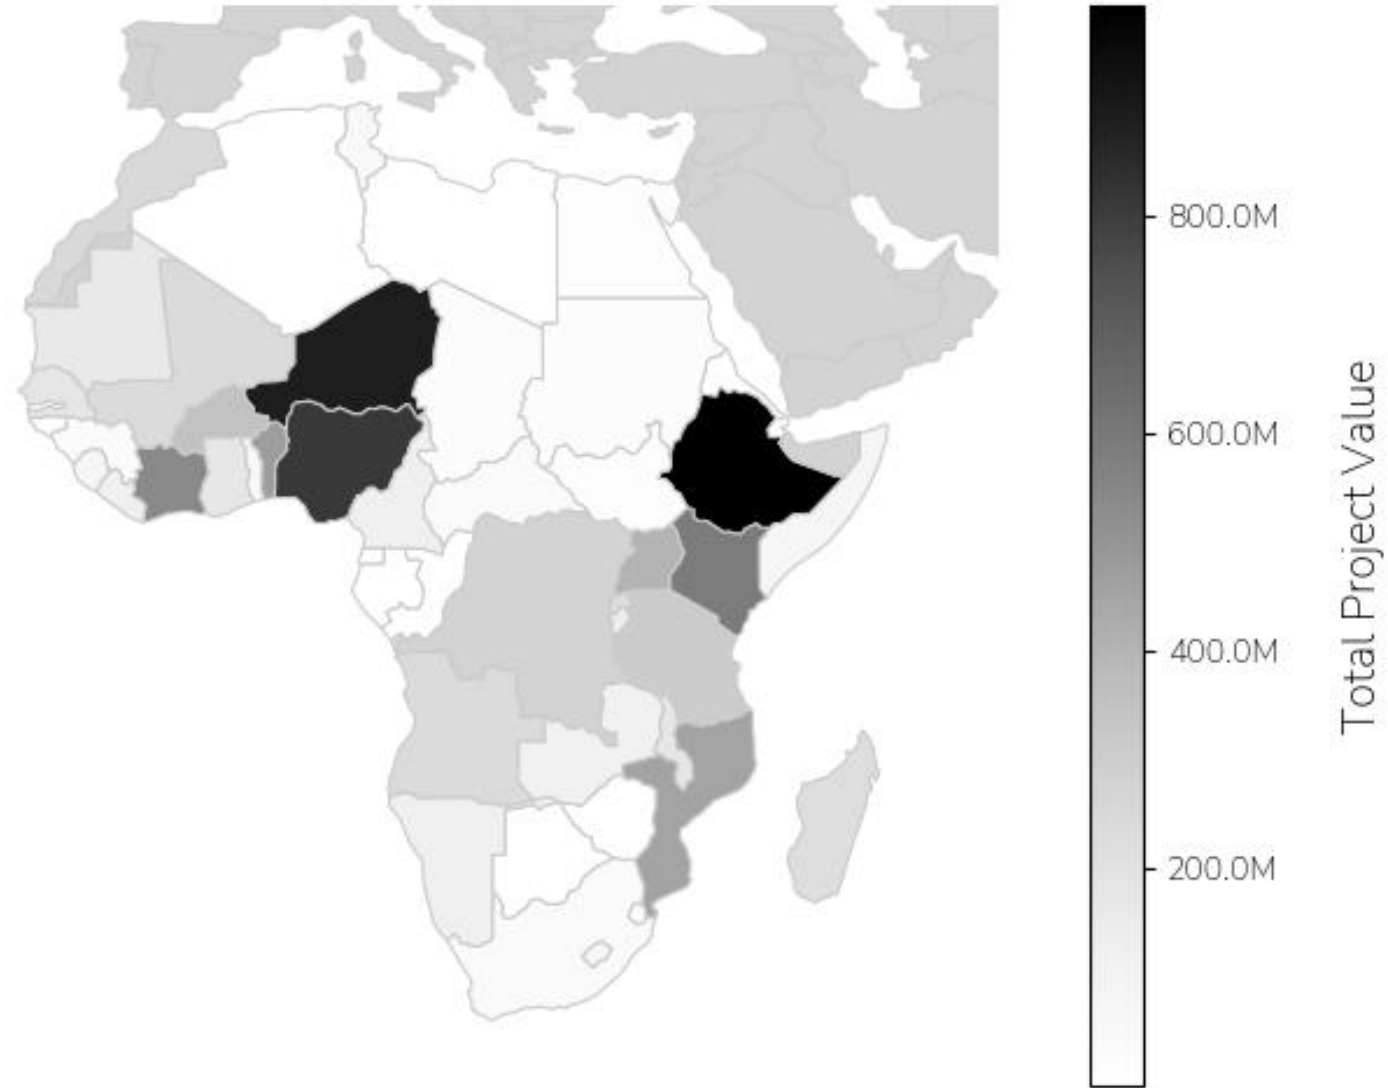

Land Projects Data Base

- [Land Projects Database](#) is a tool that tracks development funding to projects that aim to improve land governance around the world.
- Between 2012 and 2023, a total of US\$ 21.8 billion has been committed to support Land Governance projects
- Africa received the highest level of funding with \$9.18 billion allocated to 1,615 projects across 53 countries,
- Asia followed with \$4.93 billion across 86 projects in 38 countries
- South America saw \$2.80 billion invested 484 projects spanning 12 countries.

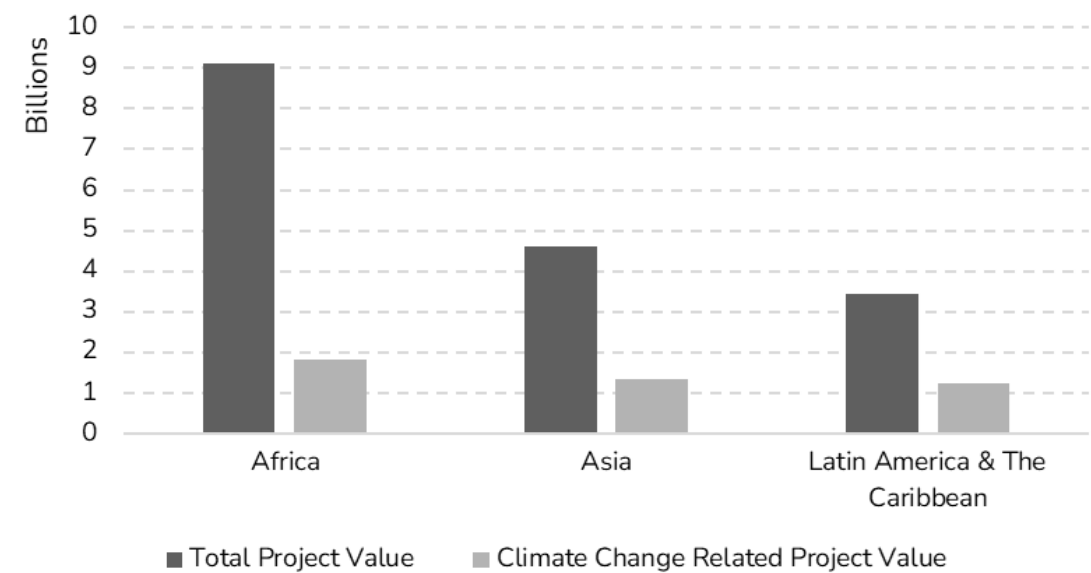

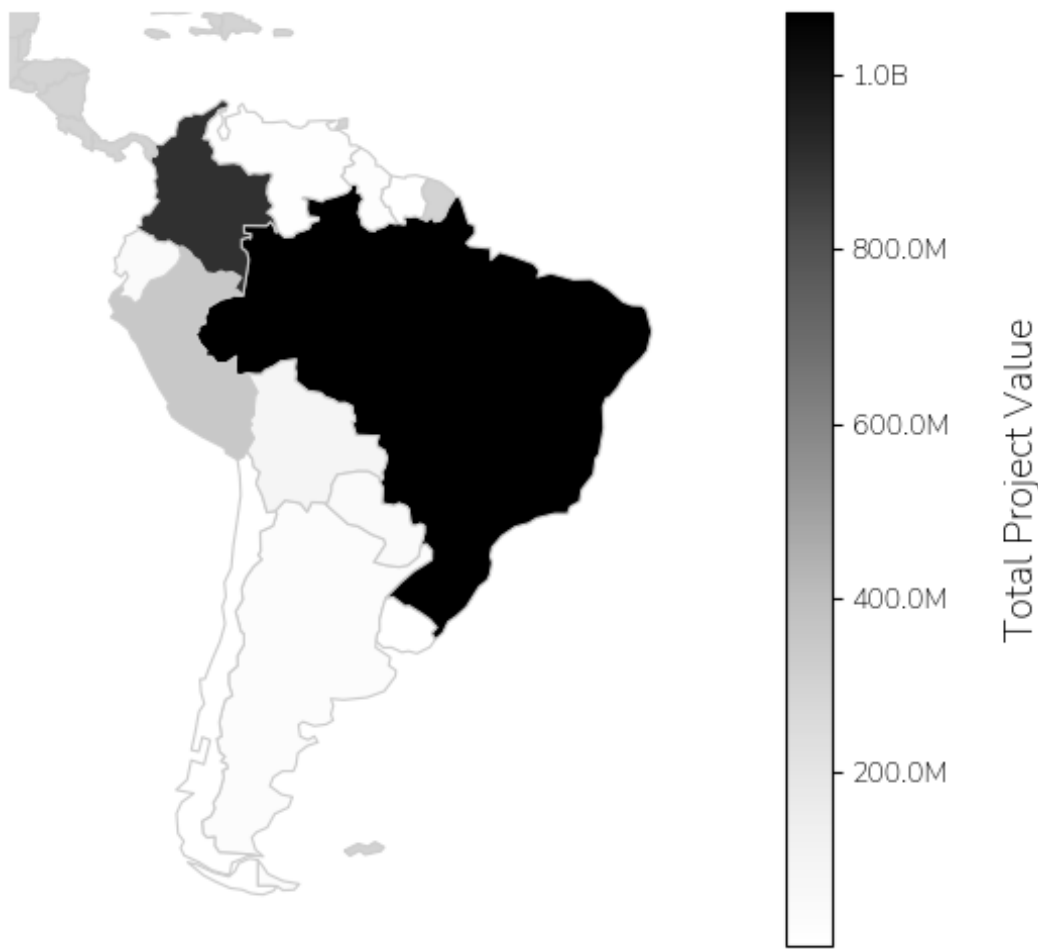

Land Projects Data Base

- **East Africa:** Highest Project Count and and 2nd highest by value.
- **West Africa:** Lower Project count, but highest by value.(Niger and Nigeria leading)
- **Southern Africa:** Fewer and and lower value investments

Land Projects Data Base

Drivers of corruption in land governance

The land sector is highly vulnerable to corruption due to the high value of land and the complexity of its governance systems. Some key risk areas include:

Key Corruption Risks	
Legal Framework	Outdated or contradictory land laws allowing elite capture Complex legal procedures exploitable for bribery Overlapping formal and customary land systems creating legal uncertainty
Institutional Capacity	Weak enforcement due to underfunded land agencies High discretion for officials in land decisions Overlapping mandates enabling policy manipulation
Availability of Information	Poor documentation of land rights, enabling fraudulent claims Lack of transparency in ownership records Missing transaction data, facilitating secretive deals

These risks are widely recognized in land governance literature and are critical to address for promoting **accountability, tenure security, and inclusive development**.

State of transparency in land governance

Source: Global Data Barometer

Land data scores just 25/100 – among the lowest across all sectors as per the assessment from the Global Data Barometer, which reflects poor availability, accessibility, and openness of land-related information.

Land data lags behind other areas like public finance (49) and procurement (47), which highlights urgent need for **investment in open, inclusive, and reliable land data systems**.

This is concerning because lack of data can foster corruption, and corruption can thrive in the absence of data

CPI & SOLI Index

We analysed two dimensions of governance:

- **perceived levels of corruption** as captured by the 2024 Corruption Perceptions Index (CPI) by Transparency International.
- CPI assesses how corrupt a country's public sector is perceived to be, with higher scores indicating cleaner governance.

- **the openness of land-related data**, measured by the State of Land Information (SOLI) Index from the Land Portal Foundation.
- The SOLI Index evaluates the availability, accessibility, and transparency of land data, which is essential for informed decision-making, secure land tenure, and accountability.

Insights from the CPI and SOLI Index

The scatter plot is divided into four quadrants:

Any correlations?

The **top right quadrant**, representing countries with **both low corruption and high transparency**, i.e. the ideal scenario, is notably empty. This absence highlights a global gap in achieving strong anti-corruption performance alongside robust, transparent land data systems.

The top left quadrant includes **countries with relatively low corruption but limited land data transparency**, such as Botswana, Rwanda, and Costa Rica. These nations have made progress on corruption control but could further benefit from more open land information systems that can help support long-term governance and equitable land access.

Any correlations?

The **lower right quadrant**, which would include countries with **transparent land systems but high corruption**, is also **empty**. This suggests that land data openness rarely exists in environments where corruption is entrenched.

The **lower left quadrant**, in contrast, is **heavily populated**. It includes most countries in the sample, where **high corruption coexists with poor land information transparency**. This combination reflects a serious governance challenge. In these settings, opaque land systems both enable and are protected by corruption, leaving citizens vulnerable to land grabs, disputes, and weak legal protections.

Final reflections

- The dominance of countries in the bottom-left quadrant points to a critical need for integrated reforms.
- Addressing corruption must be coupled with building open, accessible, and reliable land information systems.
- Without both, development efforts incl. a just energy transition will struggle to achieve lasting impact, and land rights, particularly for vulnerable groups, will remain insecure

Future Directions and a Call to Action

How can we improve the use and impact of data indicators and benchmarks to improve transparency?

- **Monitoring Progress**
- **Expansion:** The Land Portal Foundation aims to expand SOLI assessments to over 100 countries?
- **Partnerships and Collaborations**
 - **International:** the Global Land Agenda (FAO), Transparency International, Global Data Barometer
 - **Private:** Meridia, ESRI and other
 - **Community:** International Land Coalition
 - **National Governments:** Senegal, Madagascar, Western Balkans?
- **Donors:** Increase the use of data to design interventions, from conception, including data transparency as a starting point.

Use Cases

MERIDIA VERIFY®

Verify field data to assess EUDR compliance in real time.

Reduce commercial and reputational risk with evidence-based decision-making for strategic sourcing, procurement and trade.

Book a demo

Conclusions

1. There is more digital data than is being published.
 2. Universal recognition of access to information as a fundamental right.
 3. More effort to improve data collection, less so on publication
 4. Partnership between government and civil society very successful in publishing legal information.
 5. Practical tools and frameworks for sharing and exchange, a missing link?
 6. Increasing publication on Governmental Open Data Portals
-
-

Recommendations

Custodians can concentrate their efforts around these three aspects to significantly improve the data published.

1. Operationalise legal frameworks for data sharing
 2. Publication of data that already exists in the public domain
 3. Improve the existing national data portals
 4. Focus on use and services of data
